Can negative numbers be odd or even? For example, is -2 Even?

## The Big Question

Can negative numbers be odd or even? For example, is -2 Even?

YES!

#### 定义

- x is an odd number if x = 2k + 1, where k = .... 2, -1, 0, 1, 2, ....
- x is an even number if x = 2k, where  $k = \dots -2, -1, 0, 1, 2, \dots$

#### Facts about Odd and Even Numbers

- $odd \pm even = odd$   $(2k_1 + 1) \pm 2k_2 = 2(k_1 \pm k_2) + 1$
- $odd \pm odd = even$   $(2k_1 + 1) \pm (2k_2 + 1) = 2(k_1 \pm k_2)$
- $even \pm even = even$   $2k_1 \pm 2k_2 = 2(k_1 \pm k_2)$
- $odd \times even = even$   $(2k_1 + 1) \times 2k_2 = 2(2k_1k_2 + k_2)$
- $odd \times odd = odd$   $(2k_1 + 1) \times (2k_2 + 1) = 2(2k_1k_2 + k_1 + k_2) + \mathbf{1}$
- $even \times even = even$   $2k_1 \times 2k_2 = 4k_1$

Divisor and the Greatest Common Divisor

# Definitions & Examples For A Divisor(Factor) 约数 (因数)

#### 定义

When integers are multiplied, each of the multiplied integers is called a factor or divisor of the resulting product

#### 例

- (2)(3)(10) = 60, so 2,3, and 10 are factors of 60.
- The integers 4, 15, 5, and 12 are also factors of 60.
- (-2)(-30) = 60. The negatives of the positive factors are also factors of 60.
- 0 is not a factor of any integer except 0.

#### 推论

Every integer a is divisible by the trivial divisors, 1 and a.

Definitions & Examples For The Greatest Common Divisors gcd (最大公因数)

#### 定义

The greatest common divisor (or greatest common factor) of two nonzero integers c and d is the greatest positive integer that is a divisor of both c and d.

#### 例

The least common multiple of 30 and 75 is 150.

- The positive divisors of 30 are 1, 2, 3, 5, 6, 10, 15, and 30.
- The positive divisors of 75 are 1, 3, 5, 15, 25, and 75.
- The common positive divisors of 30 and 75 are 1, 3, 5, and 15.
- The greatest of these is 15.

## The Big Question

Is there a better way to find the gcd of two nonzero integers c and d?

Prime v.s. Composite

# Prime V.s. Composite 质数 V.s. 合数

### 定义

A prime number is an integer greater than 1 that has only two positive divisors: 1 and itself.

#### 定义

An integer greater than 1 that is not a prime number is called a composite number.

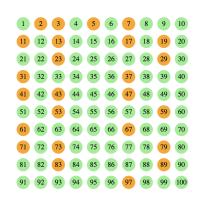

图: There are 25 prime numbers which are less than 100.

#### Divisible Rules

#### 定理 (Divisible by 2)

The last digit is even (0, 2, 4, 6, or 8). Thus, Any even number who is greater than 2 is not a prime.

## 定理 (Divisible by 3)

The Sum of digits if divisible by 3. For example, 12, 36, 93, 102.

#### 定理 (Divisible by 5)

The last digit is 0 or 5.

# Numerator, Denominator, The Common Denominator and The Mixed Number

#### Numerator V.s. Denominator 分子 v.s. 分母

A fraction is a number of the form where c and d are integers and  $d \neq 0$ .

The integer c is called the numerator of the fraction.

The integer d is called the denominator.

#### Common Denominator 公分母

The common denominator is a common multiple (ideally the least common multiple) of the denominators of two fractions.

The common denominator of  $\frac{1}{3}$  and  $\frac{2}{5}$  is 15.

#### The Mixed Number

#### Mixed Number 带分数

A mixed number consists of an integer part and a fraction part, where the fraction part has a value between 0 and 1.

The mixed number  $4\frac{3}{8}$  means  $4+\frac{3}{8}$ .

## Reciprocal

# Reciprocal 倒数

The function f(x) is defined for each positive three-digit integer n by  $f(n) = 2^x 3^y 5^z$ , where x, y, and z are hundreds, tens, and units digits of n, respectively. If m and v are three-digit positive integers such that f(m) = 9f(v), then what is the value of m -v?

$$m = 100x_1 + 10y_1 + z_1$$
 and  $v = 100x_2 + 10y_2 + z_2$   
 $\therefore f(m) = 9f(v)$   $\therefore 2^{x_1}3^{y_1}5^{z_1} = 9 \cdot 2^{x_2}3^{y_2}5^{z_2}$   
 $\therefore 2^{x_1}3^{y_1}5^{z_1} = 2^{x_2}3^{y_2+2}5^{z_2}$ 

By the uniqueness of Prime Factorization,

$$x_1 = x_2$$
,  $y_1 = y_2 + 2$ ,  $z_1 = z_2$   
 $m - v = (100x_1 + 10y_1 + z_1) - (100x_2 + 10y_2 + z_2) = 10(y_1 - y_2) = 20$
